Aggregate Demand and Sovereign Debt Crises

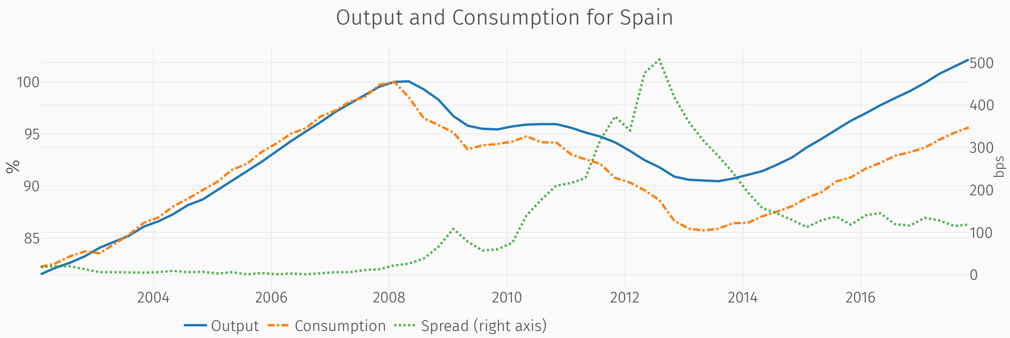
Francisco Roldán

New York University

February 2019

Motivation

- Sovereign debt crises associated with **deep** recessions ▸ More

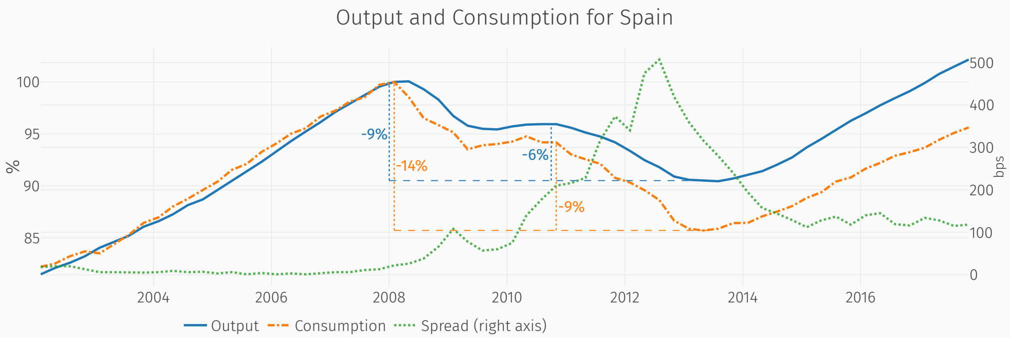


- Conventional view: low output $\implies$ high spreads

▸ Detrended data ▸ Trade balance ▸ Low demand? ▸ Nondurable consumption

MOTIVATION

- Sovereign debt crises associated with **deep** recessions ▸ More



- Conventional view: low output $\implies$ high spreads

▸ Detrended data ▸ Trade balance ▸ Low demand? ▸ Nondurable consumption

Motivation

- Spain: large output and consumption drops
  - $|\Delta C| > |\Delta Y| \implies$ Saving rate $\uparrow$ in the crisis
- IVs on Eurozone country-level data show
  1. High spreads cause output to fall
  2. High spreads cause consumption to fall **more** than output
- Large literature about costs of sovereign default – silent about costs of default *risk*
  - Agg demand irrelevant with Hand-to-mouth households / Law of One Price
  - Saving rate in the crisis?
  - Consequences?
  - Household sector manages substantial wealth (avg 96% of GDP) ▸ Spanish data
  - Substantial fraction of government debt held by residents ▸ Spanish data

Motivation

- Spain: large output and consumption drops
  - $|\Delta C| > |\Delta Y| \implies$ Saving rate $\uparrow$ in the crisis
- IVs on Eurozone country-level data show
  1. High spreads cause output to fall
  2. High spreads cause consumption to fall **more** than output

- Large literature about costs of sovereign default – silent about costs of default *risk*
  - Agg demand irrelevant with Hand-to-mouth households / Law of One Price

This Paper

- I propose a model of sovereign debt crises
    - Prominent role for household consumption/savings decision
        - Heterogeneous domestic savers can **choose** to be exposed to government debt
    - Endogenous wealth distribution that interacts with gov't default choice

- Model
    - Defaults create
        - Aggregate income losses ⟵ TFP costs of default
        - Redistributive effects ⟵ Domestic debt holdings
    - Economy looks riskier when the default probability increases
        - Default risk **interacts** with precautionary behavior

This Paper

- I propose a model of sovereign debt crises
  - Prominent role for household consumption/savings decision
    - Heterogeneous domestic savers can **choose** to be exposed to government debt
  - Endogenous wealth distribution that interacts with gov't default choice

- Model
  - Defaults create
    - Aggregate income losses $\longleftarrow$ TFP costs of default
    - Redistributive effects $\longleftarrow$ Domestic debt holdings
  - Economy looks riskier when the default probability increases
    - Default risk **interacts** with precautionary behavior

This Paper

- I propose a model of sovereign debt crises
  - Prominent role for household consumption/savings decision
    - Heterogeneous domestic savers can **choose** to be exposed to government debt
  - Endogenous wealth distribution that interacts with gov't default choice

How is sovereign risk costly?

Feedback loop between spreads and output

$\uparrow$ Spreads $\Longrightarrow$ $\downarrow$ Demand $\Longrightarrow$ $\downarrow$ Output

- Model
  - Defaults create
    - Aggregate income losses $\longleftarrow$ TFP costs of default
    - Redistributive effects $\longleftarrow$ Domestic debt holdings
  - Economy looks riskier when the default probability increases
    - Default risk **interacts** with precautionary behavior

Main findings

- Sovereign risk makes the response of output to shocks
  - Nonlinear
  - State-dependent
- Feedback effect explains significant portion of the crisis
  - 20% of output contraction attributable to default
- Large welfare effects
  - Volatility of output and consumption 30% and 120% higher
  - Unemployment twice as large
  - Households would give up 10% of permanent consumption to avoid defaults
- New light on Aguiar-Gopinath facts More
  - Amplification of negative shocks, demand-driven recessions
  - In downturns volatility of $C >$ volatility of Y

- Description of Model
- Model Results
- Simulations
- Crises

Evidence

- Regress outcome variable Q_{jt} on country j's spread

$$Q_{jt} = \beta \Delta Spread_{jt} + \gamma X_{jt} + \delta_t + \mu_j + \epsilon_{jt}$$

where $Q_{jt} = \log Y_{jt}, \log C_{jt}$

- IV strategy (based on Martin and Philippon, 2017)

$$\Delta Spread_{jt} = \underbrace{\phi B_{j0} + \delta_t}_{Z_{jt}} + \eta_{jt}$$

- Data for 11 European countries between 2010Q1 – 2013Q1

Austria, Belgium, Denmark, Finland, France, Germany, Ireland, Italy, Netherlands, Portugal, Spain

Feedback

	Dependent variable:			
	$\log Y_{jt}$	$\log C_{jt}$	$\log Y_{jt}$	$\log C_{jt}$

▸ The Cycle is the Trend

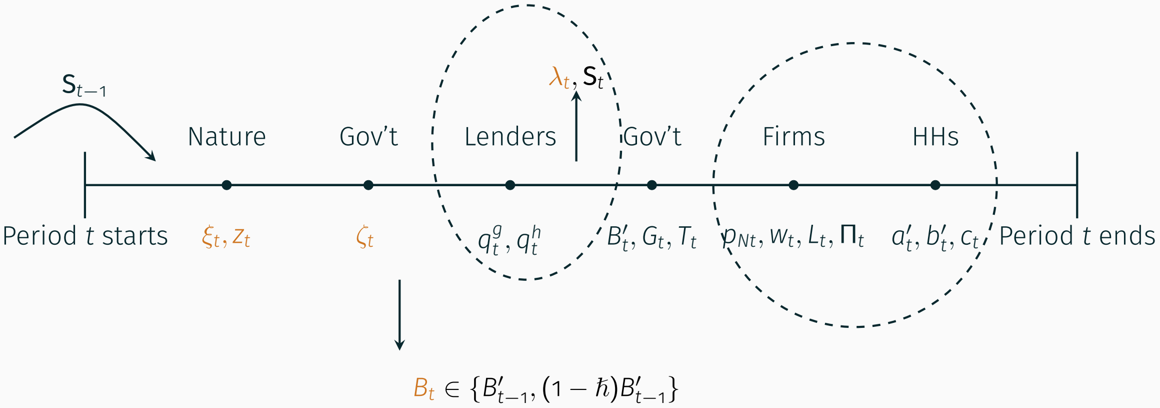
Description of Model

General Description

- Small open economy with
  - Uninsurable idiosyncratic income risk + Incomplete markets
  - Default risk
  - Nominal rigidities
- Actors:
  - A government
    - Issues long-term debt, purchases goods, decides repayment
  - Households
    - Consume, work, save in the gov't **bond** + risk-free **debt**
    - Differ in 'cash' holdings, idiosyncratic income shock
  - Firms
    - Produce the goods with labor, subject to **wage rigidities**
  - Foreigners
    - Lend to the government and to the private sector
    - Price all assets

Timeline

Jump to Gov't objective



Decisions within a period

Dashed ellipses encircle simultaneous decisions

Government Policy

At each t, the government

- Chooses **repayment** $h_t \in \{1, 1-\hbar\}$
- Follows fiscal rules for new **issuances** $B'(\mathbf{S}_t)$ and spending $G(\mathbf{S}_t)$
  - Can depend on full state: $(B_t, \lambda_t, \xi_t, \zeta_t, z_t)$ ▸ Fiscal rules
- Must satisfy its budget constraint

$$\underbrace{q_t^g}_{\text{debt price}} \underbrace{(B_t' - (1-\rho)B_t)}_{\text{new debt issued}} + \underbrace{T_t}_{\text{lump-sum}} + \underbrace{\tau w_t L_t}_{\text{payroll tax}} = \underbrace{G_t}_{\text{spending}} + \underbrace{\kappa B_t}_{\text{coupon}}$$

$\rightarrow$ T_t summarizes a default / austerity tradeoff

Private Economy

Given a government policy $h(\mathsf{S},\xi',z'), B'(\mathsf{S}), T(\mathsf{S},q^g)$, in a comp eq'm

- Risk-neutral foreigners ▸ General Formulation
  - Price all assets

$$q^h(\mathsf{S}) = \frac{1}{1+r^\star}$$

$$q^g(\mathsf{S}) = \frac{1}{1+r^\star}\mathbb{E}\left[\underbrace{\mathbb{1}_{(\zeta'=1)}(1-\xi')\kappa}_{coupon} + \underbrace{(1-\rho)}_{depreciation}\underbrace{\left(1-\hbar\mathbb{1}_{(\zeta=1\cap\zeta'\neq 1)}\right)}_{potential\ haircut}\underbrace{q^g(\mathsf{S}')}_{resale\ price}\ \Big|\ \mathsf{S}\right]$$

Private Economy

Given a government policy $h(\mathsf{S}, \xi', z'), B'(\mathsf{S}), T(\mathsf{S}, q^g)$, in a comp eq'm

- Risk-neutral foreigners ▸ General Formulation
  - Price all assets

$$q^g(\mathsf{S}) = \underbrace{\frac{1}{1+r^\star}}_{q^h(\mathsf{S})} \mathbb{E}\left[\underbrace{\mathbb{1}_{(\zeta'=1)}(1-\xi')\kappa}_{\text{coupon}} + \underbrace{(1-\rho)}_{\text{depreciation}} \underbrace{\left(1-\hbar\mathbb{1}_{(\zeta=1\cap\zeta'\neq1)}\right)}_{\text{potential haircut}} \underbrace{q^g(\mathsf{S}')}_{\text{resale price}} \;\Big|\; \mathsf{S} \right]$$

- Firms
  - Traded and nontraded goods, CES aggregator, wage rigidities

$$Y_{Nt} = L_{Nt}^{\alpha_N}\left(1-\Delta\mathbb{1}_{(\zeta\neq1)}\right) \qquad Y_{Tt} = z_t L_{Tt}^{\alpha_T}\left(1-\Delta\mathbb{1}_{(\zeta\neq1)}\right) \qquad W_t \geq \bar{W}$$

Given a government policy $h(\mathbf{S}, \xi', z'), B'(\mathbf{S}), T(\mathbf{S}, q^g)$, in a comp eq'm

- Risk-neutral foreigners ▸ General Formulation
  - Price all assets

$$q^g(\mathbf{S}) = \underbrace{\frac{1}{1+r^\star}}_{q^h(\mathbf{S})} \mathbb{E}\left[\underbrace{\mathbb{1}_{(\zeta'=1)}(1-\xi')\kappa}_{\text{coupon}} + \underbrace{(1-\rho)}_{\text{depreciation}} \underbrace{\left(1-\hbar\mathbb{1}_{(\zeta=1\cap\zeta'\neq1)}\right)}_{\text{potential haircut}} \underbrace{q^g(\mathbf{S}')}_{\text{resale price}} \;\middle|\; \mathbf{S} \right]$$

- Firms
  - Traded and nontraded goods, CES aggregator, wage rigidities

$$Y_{Nt} = L_{Nt}^{\alpha_N}\left(1-\Delta\mathbb{1}_{(\zeta\neq1)}\right) \qquad Y_{Tt} = z_t L_{Tt}^{\alpha_T}\left(1-\Delta\mathbb{1}_{(\zeta\neq1)}\right) \qquad W_t \geq \bar{W}$$

- Households
  - Access to both assets with borrowing limits, inelastic labor supply
- Approximation: $\lambda_t = \log\mathcal{N}(\mu_t, \Sigma_t)$. So $\mathbf{S} = (B, \mu, \sigma, \xi, \zeta, z)$

Households

- Given govt's policies, aggregates, and evolution of the state

$$v(\omega,\epsilon,\mathsf{S})^{\frac{\psi-1}{\psi}} = \max_{c,a',b'} (1-\beta)c^{\frac{\psi-1}{\psi}} + \beta\mathbb{E}\left[\left(v(\underbrace{a' + R_{\mathsf{S},\mathsf{S}'}b'}_{=\omega'},\epsilon',\mathsf{S}')\right)^{1-\gamma}\middle|\,\omega,\epsilon,\mathsf{S}\right]^{\frac{\psi-1}{\psi(1-\gamma)}}$$

$$\begin{aligned}
\text{subject to } p_C(\mathsf{S})c + q^h(\mathsf{S})a' + q^g(\mathsf{S})b' &= \omega + \ell(\mathsf{S})\epsilon - T(\mathsf{S}) \\
\ell(\mathsf{S}) &= w(\mathsf{S})L(\mathsf{S})(1-\tau) + \Pi(\mathsf{S}) \\
R_{\mathsf{S},\mathsf{S}'} &= \mathbb{1}_{(\zeta'=1)}\kappa + (1-\rho)\left(1-\hbar\mathbb{1}_{(\zeta=1)(\zeta'\neq 1)}\right)q^g(\mathsf{S}') \\
a' \geq \bar{a}; &\qquad b' \geq 0 \\
\mathsf{S}' &= \Psi(\mathsf{S},\xi',z',h') \\
&\text{Exog LoMs for } (\epsilon,\xi,z)\text{; prob of } h' \text{ given } \left(\mathsf{S},\xi',z'\right)
\end{aligned}$$

Households

- Given govt's policies, aggregates, and evolution of the state

$$V(\omega,\epsilon,\mathrm{S})^{\frac{\psi-1}{\psi}} = \max_{c,a',b'} (1-\beta)c^{\frac{\psi-1}{\psi}} + \beta\mathbb{E}\left[\left(V(\underbrace{a' + R_{\mathrm{S},\mathrm{S}'} b'}_{=\omega'}, \epsilon', \mathrm{S}')\right)^{1-\gamma} \middle| \omega,\epsilon,\mathrm{S}\right]^{\frac{\psi-1}{\psi(1-\gamma)}}$$

$$\text{subject to } p_C(\mathrm{S})c + q^h(\mathrm{S})a' + q^g(\mathrm{S})b' = \omega + \ell(\mathrm{S})\epsilon - T(\mathrm{S})$$

$$R_{\mathrm{S},\mathrm{S}'} = \mathbb{1}_{(\zeta'=1)}\kappa + (1-\rho)\left(1 - \hbar\mathbb{1}_{(\zeta=1)(\zeta'\neq 1)}\right) q^g(\mathrm{S}')$$

- Skipping steps: in crisis times
  - $\pi \uparrow \implies \mathbb{E}[w'L'] = \pi\mathbb{E}[w'L'|\zeta' \neq 1] + (1-\pi)\mathbb{E}[w'L'|\zeta' = 1] \downarrow \leftarrow$ Aggregate effect
  - $q^g \downarrow \implies \omega \downarrow$ for all $\leftarrow$ Distributional effect
  - $\mathrm{cov}(R_{\mathrm{S},\mathrm{S}'}, sdf' \mid \mathrm{S}) \downarrow$ $\leftarrow$ 'Savings technology' effect

- Given govt's policies, aggregates, and evolution of the state

$$V(\omega,\epsilon,S)^{\frac{\psi-1}{\psi}} = \max_{c,a',b'} (1-\beta)c^{\frac{\psi-1}{\psi}} + \beta\mathbb{E}\left[\left(V(\underbrace{a' + R_{S,S'}b'}_{=\omega'},\epsilon',S')\right)^{1-\gamma} \middle| \omega,\epsilon,S\right]^{\frac{\psi-1}{\psi(1-\gamma)}}$$

$$\text{subject to } p_C(S)c + q^h(S)a' + q^g(S)b' = \omega + \ell(S)\epsilon - T(S)$$

$$R_{S,S'} = \mathbb{1}_{(\zeta'=1)}\kappa + (1-\rho)\left(1-\hbar\mathbb{1}_{(\zeta=1)(\zeta'\neq 1)}\right)q^g(S')$$

- Skipping steps: in crisis times
  - $\pi\uparrow \implies \mathbb{E}[w'L'] = \pi\mathbb{E}[w'L'|\zeta'\neq 1] + (1-\pi)\mathbb{E}[w'L'|\zeta'=1]\downarrow$ ← Aggregate effect
  - $q^g\downarrow \implies \omega\downarrow$ for all ← Distributional effect
  - $\text{cov}(R_{S,S'}, sdf' \mid S)\downarrow$ ← 'Savings technology' effect

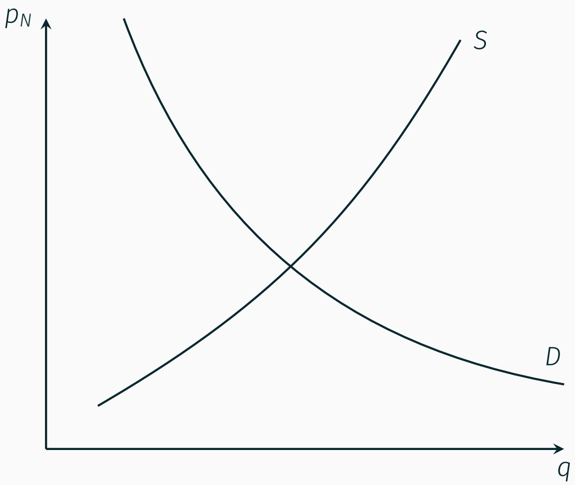
- Given govt's policies, aggregates, and evolution of the state

$$v(\omega, \epsilon, S)^{\frac{\psi-1}{\psi}} = \max_{c,a',b'} (1-\beta)c^{\frac{\psi-1}{\psi}} + \beta\mathbb{E}\left[\left(v(\underbrace{a' + R_{S,S'}b'}_{=\omega'}, \epsilon', S')\right)^{1-\gamma} \middle| \omega, \epsilon, S\right]^{\frac{\psi-1}{\psi(1-\gamma)}}$$

$$\text{subject to } p_C(S)c + q^h(S)a' + q^g(S)b' = \omega + \ell(S)\epsilon - T(S)$$

$$R_{S,S'} = \mathbb{1}_{(\zeta'=1)}\kappa + (1-\rho)\left(1 - \hbar\mathbb{1}_{(\zeta=1)(\zeta'\neq 1)}\right) q^g(S')$$

- Skipping steps: in crisis times
  - $\pi \uparrow \implies \mathbb{E}[w'L'] = \pi\mathbb{E}[w'L'|\zeta' \neq 1] + (1-\pi)\mathbb{E}[w'L'|\zeta' = 1] \downarrow \leftarrow$ Aggregate effect
  - $q^g \downarrow \implies \omega \downarrow$ for all $\leftarrow$ Distributional effect
  - $\text{cov}(R_{S,S'}, sdf' \mid S) \downarrow$ $\leftarrow$ 'Savings technology' effect

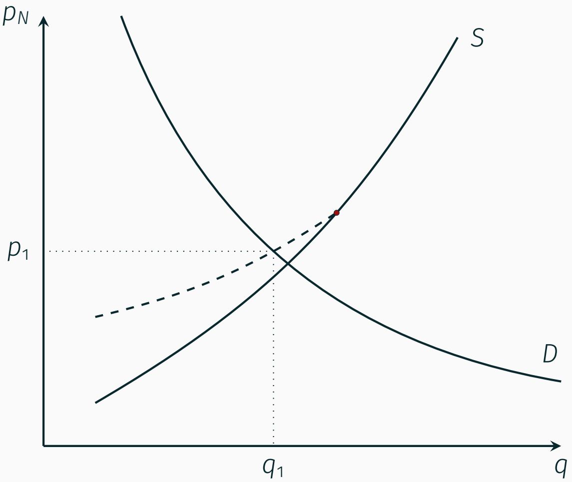


$$Y_N^d = C\varpi \left(\frac{p_N}{p_C}\right)^{-\eta} + \frac{\vartheta_N}{p_N} G$$

$$Y_N^s = L_N^{\alpha_N} \left(1 - \mathbb{1}_{(\zeta \neq 1)} \Delta\right)$$

$$L_N^d = \left(\alpha_N \frac{p_N}{w}\right)^{\frac{1}{1-\alpha_N}}$$

Aggregate Demand

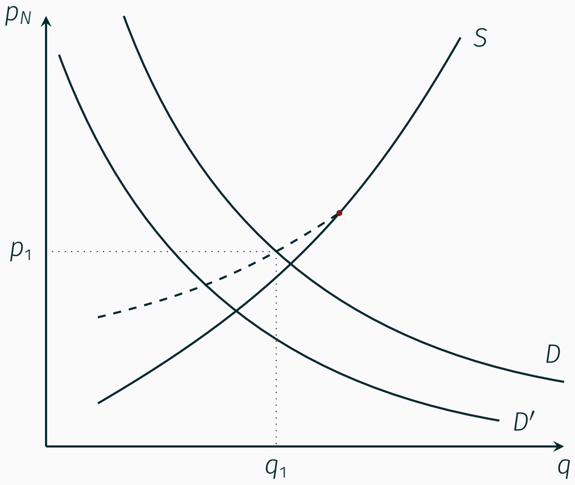


$$Y_N^d = C\varpi \left(\frac{p_N}{p_C}\right)^{-\eta} + \frac{\vartheta_N}{p_N} G$$

$$Y_N^s = L_N^{\alpha_N} \left(1 - \mathbb{1}_{(\zeta \neq 1)} \Delta\right)$$

$$L_N^d = \left(\alpha_N \frac{p_N}{\max\{w, \bar{w}\}}\right)^{\frac{1}{1-\alpha_N}}$$

Aggregate Demand



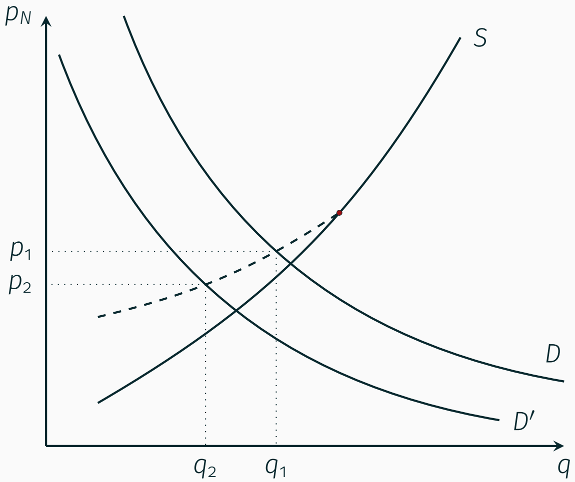
$$Y_N^d = C\varpi\left(\frac{p_N}{p_C}\right)^{-\eta} + \frac{\vartheta_N}{p_N}G$$

$$Y_N^s = L_N^{\alpha_N}\left(1 - \mathbb{1}_{(\zeta\neq 1)}\Delta\right)$$

$$L_N^d = \left(\alpha_N \frac{p_N}{\max\{w, \bar{w}\}}\right)^{\frac{1}{1-\alpha_N}}$$

- $C \downarrow \implies p_N \downarrow \implies w \downarrow$

Aggregate Demand



$$Y_N^d = C\varpi \left(\frac{p_N}{p_C}\right)^{-\eta} + \frac{\vartheta_N}{p_N} G$$

$$Y_N^s = L_N^{\alpha_N}\left(1 - \mathbb{1}_{(\zeta \neq 1)}\Delta\right)$$

$$L_N^d = \left(\alpha_N \frac{p_N}{\max\{w, \bar{w}\}}\right)^{\frac{1}{1-\alpha_N}}$$

- $C \downarrow \implies p_N \downarrow \implies w \downarrow$
- Wage rigidity creates price stickiness

The Government's Objective

Back to Timeline

- B_t' and G_t are given functions of S_t
- Default / Repayment is an optimal **choice**
  - Utilitarian objective

$$\mathcal{W}(\mathsf{S}) = \int v(\mathsf{s}, \mathsf{S}) d\lambda_{\mathsf{S}}(\mathsf{s})$$

- In period t, observe S_{t-1} and (ξ_t, z_t)
- Gov't understands $\mathsf{S}_t = \Psi(\mathsf{S}_{t-1}, \xi_t, z_t, \zeta_t)$ Distribution
- Default iff

$$\underbrace{\mathcal{W}\left(\Psi(\mathsf{S}_{t-1}, \xi_t, z_t, \zeta_t \neq 1)\right)}_{\text{v under def}} - \underbrace{\mathcal{W}\left(\Psi(\mathsf{S}_{t-1}, \xi_t, z_t, \zeta_t = 1)\right)}_{\text{v under rep}} \geq \sigma_g \xi_t^{\text{def}}$$

where $\xi_t^{\text{def}} \overset{iid}{\sim} \mathcal{N}(0, 1)$

- B_t' and G_t are given functions of $\mathbf{S}_t$
- Default / Repayment is an optimal **choice**
    - Utilitarian objective

$$\mathcal{W}(\mathbf{S}) = \int v(\mathbf{s}, \mathbf{S}) d\lambda_{\mathbf{S}}(\mathbf{s})$$

    - **But B_t, ζ_t are part of $\mathbf{S}_t$!**
    - Gov't understands $\mathbf{S}_t = \Psi(\mathbf{S}_{t-1}, \xi_t, z_t, \zeta_t)$ Distribution
    - Default iff

$$\underbrace{\mathcal{W}\left(\Psi(\mathbf{S}_{t-1}, \xi_t, z_t, \zeta_t \neq 1)\right)}_{\text{v under def}} - \underbrace{\mathcal{W}\left(\Psi(\mathbf{S}_{t-1}, \xi_t, z_t, \zeta_t = 1)\right)}_{\text{v under rep}} \geq \sigma_g \xi_t^{\text{def}}$$

where $\xi_t^{\text{def}} \overset{iid}{\sim} \mathcal{N}(0, 1)$

THE GOVERNMENT'S OBJECTIVE

Back to Timeline

- B'_t and G_t are given functions of $\mathbf{S}_t$
- Default / Repayment is an optimal **choice**
  - Utilitarian objective

$$\mathcal{W}(\mathbf{S}) = \int v(\mathbf{s}, \mathbf{S}) d\lambda_{\mathbf{S}}(\mathbf{s})$$

  - In period t, observe $\mathbf{S}_{t-1}$ and (ξ_t, z_t)
  - Gov't understands $\mathbf{S}_t = \Psi(\mathbf{S}_{t-1}, \xi_t, z_t, \zeta_t)$ Distribution
  - Default iff

$$\underbrace{\mathcal{W}\left(\Psi(\mathbf{S}_{t-1}, \xi_t, z_t, \zeta_t \neq 1)\right)}_{\text{v under def}} - \underbrace{\mathcal{W}\left(\Psi(\mathbf{S}_{t-1}, \xi_t, z_t, \zeta_t = 1)\right)}_{\text{v under rep}} \geq \sigma_g \xi_t^{\text{def}}$$

where $\xi_t^{\text{def}} \overset{iid}{\sim} \mathcal{N}(0, 1)$

Definition

Given fiscal rules $B'(\mathbf{S}), G(\mathbf{S})$, an *equilibrium* consists of

Algorithm

- A government policy $h'(\mathbf{S}, \xi', z'), T(\mathbf{S})$
- Policy functions $\{\phi_a, \phi_b, \phi_c\}(\mathbf{s}, \mathbf{S})$
- Prices $p_C(\mathbf{S}), p_N(\mathbf{S}), w(\mathbf{S}), q^g(\mathbf{S})$. Quantities $L_N(\mathbf{S}), L_T(\mathbf{S}), \Pi(\mathbf{S}), T(\mathbf{S})$
- Laws of motion $\mu'(\mathbf{S}, \xi', z'; h), \sigma'(\mathbf{S}, \xi', z'; h)$

such that

- The policy functions solve the household's problem
- The laws of motion are consistent with the policy functions
- Firms maximize profits, $w(\mathbf{S}) \geq \bar{w}$, markets clear Market Clearing
- h' maximizes $\mathcal{W}(\Psi(\mathbf{S}, \xi', z', \cdot))$ for gov't, taxes respect budget constraint.

Table 2: Models

Still Missing

- Compare episodes of high spreads in simulated data against
    - No TFP costs of default $\leftarrow$ shuts down aggregate income losses
        - $\Delta = 0$
    - 'Meaningless' default $\leftarrow$ shuts down redistributive wealth effects
        - Keep paying coupons in default + no haircut

  $\rightarrow$ Notions of **potential** output

- Difference is amplification through extra precautionary behavior
    - Different benchmarks emphasize different channels

Concluding Remarks

- Interested in **interaction** of
  - Default risk
  - Precautionary behavior

  \+ implications for **amplification** of shocks

- Channel helps explain severity of Eurozone debt crisis
  - Default risk creates high **volatility** of consumption and unemployment
  - Large welfare **costs** of sovereign risk – up to 10% of permanent consumption

- Key:
  - Aggregate + redistributive wealth effects if default
  - Agents take precautions against those
  - Timing flips usual MPC / transfer argument

Measuring Exposures to Sovereign Debt - Banks

Measure exposure based on Philippon and Salord (2017)

- study European banks resolutions in Cyprus
- average total recapitalization need was around 17.4% of assets
- private investors provided 33% of need via loss in equity (91%), junior debt (53%) and senior debt (14%)
- remaining 2/3 came from government intervention

→ assumed not possible in Spain!
→ remaining need comes from senior debt and depositors

Back

Measuring Exposures to Sovereign Debt - Deposits

Work with different scenarios of loss on deposits:

Scenario	SD Loss	Dep. Loss
Extreme	25%	14%
Mild	50%	10%
Conservative	75%	5%

Table 3: Expected losses on deposits

- Assume a 50% haircut on public debt that triggers a bank crisis
- Loss for depositors of 10%
- Overall, public debt and bank crisis would induce a fall of between 8% and 10% of financial assets

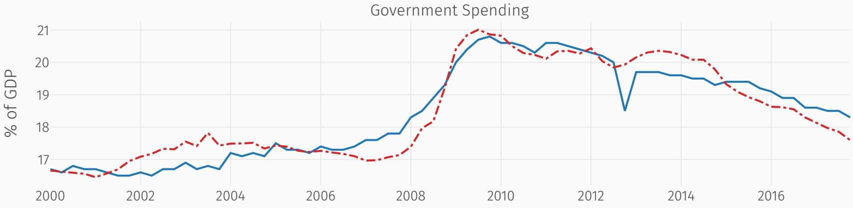
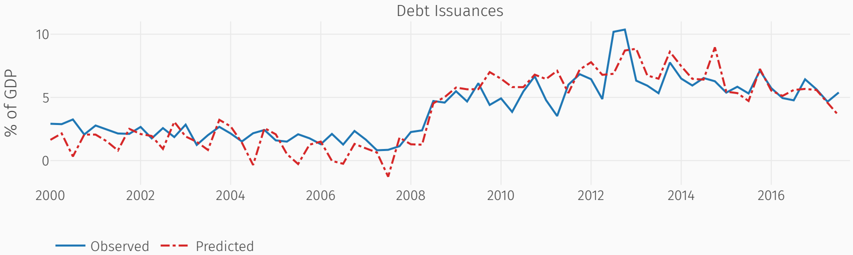
Fiscal Rules (cont'd)





Evolution of the Distribution

The law of motion for λ

- Policy functions ϕ_a, ϕ_b at S_t determine assets at $t+1$
- After seeing z_{t+1}, the government decides **repayment**
- At S_{t+1}, relationship between $q^g(\mathsf{S}_{t+1})$, $R_b(\mathsf{S}_{t+1})$, μ_{t+1}, σ_{t+1}

$$R_b(\mathsf{S}_{t+1}) = \mathbb{1}_{(\zeta_{t+1}=1)}\kappa + (1-\rho)q^g(\mathsf{S}_{t+1})$$

$$\int \omega d\lambda_{t+1} = \int \phi_a(\mathsf{S}_t) + R_b(\mathsf{S}_{t+1})\phi_b(\mathsf{S}_t) d\lambda_t$$

$$\int \omega^2 d\lambda_{t+1} = \int \left(\phi_a(\mathsf{S}_t) + R_b(\mathsf{S}_{t+1})\phi_b(\mathsf{S}_t)\right)^2 d\lambda_t$$

General SDF of Foreigners

- If risk-averse foreigners

$$q_t^h = \frac{1}{1+r^\star}\mathbb{E}_t\left[\left(\frac{C_{t+1}^f}{C_t^f}\right)^{-\gamma_f}\right]$$

$$q_t^g = \frac{1}{1+r^\star}\mathbb{E}_t\left[\left(\frac{C_{t+1}^f}{C_t^f}\right)^{-\gamma_f} R_{t,t+1}^b\right]$$

where $R_{t,t+1}^b = \mathbb{1}_{(\zeta_{t+1}=1)}\tilde{\kappa} + (1-\rho)(1-\hbar\mathbb{1}_{(\zeta_t=1\cap\zeta_{t+1}\neq 1)})q_{t+1}^g$

- Reduces to risk-neutral if

$$\text{cov}\left(\left(\frac{C_{t+1}^f}{C_t^f}\right)^{-\gamma_f}, R_{t,t+1}^b\right) = 0$$

Back

Solution Method

- Guess a policy for the government
  - Guess a law of motion for the distribution
    - Compute $q^g(\mathsf{S}), q^h$ from lenders' sdf.
    - Compute w, L_N, L_T, Π, T as functions of (S, p_N)
    - Guess a relative price of nontraded goods p_N
      - Solve the household's problem at $(\mathsf{s}, \mathsf{S}, p_N)$
      - Check market clearing for nontraded goods.
    - Iterate until $p_N(\mathsf{S})$ converges
  - Iterate until the law of motion converges
- Iterate on the government's policy
